CS 211 Data Structures and Algorithms Lab
Autumn 2021

Assignment no.	*6*
Objective	*To implement BFS and to use it to solve single-source shortest path problem on undirected graphs*
Total marks	*10*
Due date (without penalty)	*25th October (Monday) 11:59 pm*
Cut-off date (with penalty - 5%)	*29th October (Friday) 11:59 pm*
Penalty for violating naming convention(s)	*5%*

Input

Your program should accept an input file as a command-line argument. A typical execution of your program will be **./a.out sample.graph**

The input file represents an <u>undirected graph</u>. The first line of the file contains two numbers: (i) the number of vertices *n*; (ii) the number of edges *m*. The vertices are numbered from *0 to n-1*. Every other line is of the form: x y, which represents *an undirected edge* between vertex *x* and y. No edge is repeated in the input file. The vertex *0* is the source (starting) vertex from which you need to find the <u>shortest distances to other vertices</u>.

Your program may create an adjacency list of the input graph.

Task

Implement BFS and use it to find the shortest distance of every vertex from the source vertex (0). The output file should be named as 'sd.txt'. <u>Every line in the output file should have exactly one integer</u> which represents the distance between the source vertex and the vertex with label k-1, where k is the line number. For example, *the first line should have the distance between the source vertex 0 and the vertex 0 -* of course, *this value is always 0*. The output file must have exactly *n lines*. The graph that will be used for evaluation will have at least 1000 vertices and at most 2000 vertices.

Note#1: if there is no path exists from the source vertex 0 to any other given vertex (means if no shortest path exists from the source vertex), then the output file should contain "-1" at that vertex

Note#2: if there is no vertex is presented in the given input file, in that case also the output file should contain value "-1" at that vertex

Submission

- The program you submit should output ***'sd.txt'*** when run.
- The main file of your program should be named as <roll no>.<extension>, where roll no. specifies your roll no. and the extension depends on the language you choose (Usage of C is mandatory for this assignment). Ex: 200010001.c.
- Test well before submission. You may use the attached sample input file for testing. The corresponding output file is also attached. We have some hidden inputs with us to test your program. The mark you obtain is purely based on whether your program correctly gives outputs for the hidden inputs.
- If your program has only a single source file, please submit the file as it is. If your program has multiple source files, please submit your code as a zip file where the name of the zip file should be your roll number. It is important that you follow the input/output conventions exactly (including the naming scheme) as we may be doing an automated evaluation. ***There will be a penalty of 5% (on the mark you deserve otherwise) if you do not follow the naming conventions exactly.***
- Follow some coding style uniformly. Provide proper comments in your code.
- Submit only through moodle. Submit well in advance. Any hiccups in the moodle/internet at the last minute is never acceptable as an excuse for late submission. Submissions through email or any other means will be ignored.
- Acknowledge the people (other than the instructor and TA) who helped you to solve this assignment. The details of the help you received and the names of the people who helped you (including internet sources, if applicable) should come in the beginning of the main file as a comment. Copying others' programs is a serious offence and a deserving penalty will be imposed if found.

Evaluation

- To consider for the first evaluation without penalty, you have to submit your program by the due date. If you submit after the ***due date*** but on or before the ***cut-off date***, ***there will be a penalty of 5% on the marks you deserve otherwise***.

- If you do not submit by the ***cut-off date,*** your program will not be considered for the first evaluation.

- We will do the first evaluation after the cut-off date. The marks you obtain will be proportional to the number of correct lines in the output files. We will use the 'diff' program to check the differences between the correct output file and the output file generated by your program. So, you may verify the correctness of the output file by using the diff program with a sample output file before submission. (See the man page of diff for more info).

- We will do the second evaluation later. This is for those who want to improve their marks obtained in the first evaluation or who do not submit for the first evaluation. There will be **a penalty of 20%** for those who are submitting for the second evaluation. The details of the second evaluation will be shared later.
